Emergent Scroll Video Hero Kit

Welcome. This guide shows the exact workflow for using Emergent with the included prompt file and an uploaded MP4. The goal is simple: preserve the reference website style closely, then rebuild only the hero/header around a scroll-controlled video.

Quick Start: upload your MP4, upload **NT Scroll Video Hero Prompt.txt**, paste the website reference, choose settings, and press enter.

Simple Method

- Open https://app.emergent.sh/home.
- Choose Landing Page.
- Upload your MP4 video.
- Upload NT Scroll Video Hero Prompt.txt.
- Paste the reference website URL, copied site text, or screenshots into the chat.
- Choose the settings you want, then submit.

Enhanced Method

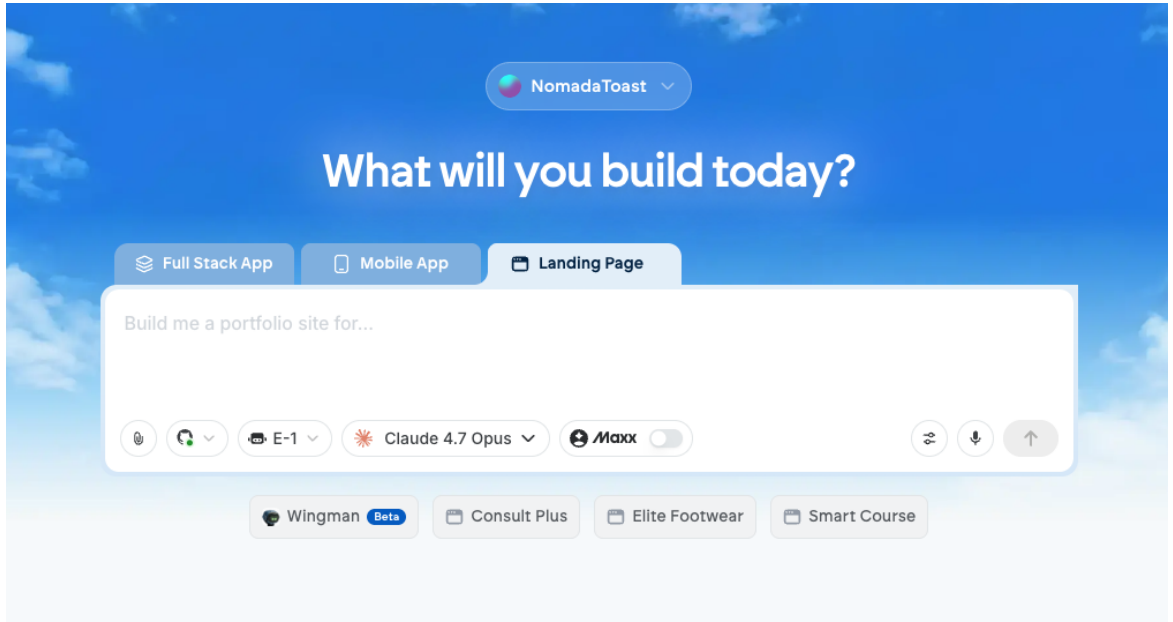
Use the same process, then add more project detail before submitting. This helps Emergent make better design and copy decisions while still following the core prompt.

- placeholder brand name
- target audience
- tone of voice
- sections below the hero
- preferred CTA text
- video timestamps or moments to sync with text

Example extra instruction:

> The website is for a premium productivity app for creative teams. Use the placeholder brand name "BrandName". Keep the same clean SaaS feel as the reference site. Use the attached MP4 as the main full-screen scroll-controlled hero.

Step 1: Start from Landing Page mode



Goal

Set Emergent to build the right kind of output before adding files.

What to do

- Open app.emergent.sh/home and choose Landing Page.

- This tells Emergent you want a website page rather than a full app or mobile app.

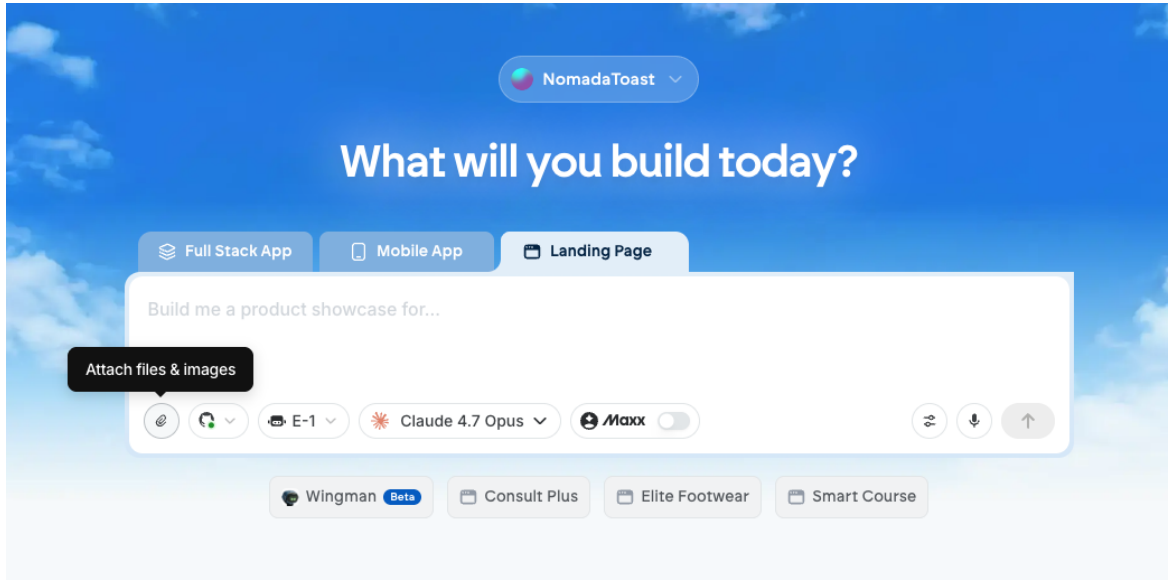
- Keep this selected for the scroll-video hero workflow.

Before moving on

You should see Landing Page selected above the main prompt box.

Back to index

Step 2: Open the attachment control



Goal

Prepare the chat so the prompt file and MP4 can be attached.

What to do

- Click the paperclip button in the prompt area.

- Use it to attach the MP4 video and the NT Scroll Video Hero Prompt.txt file.

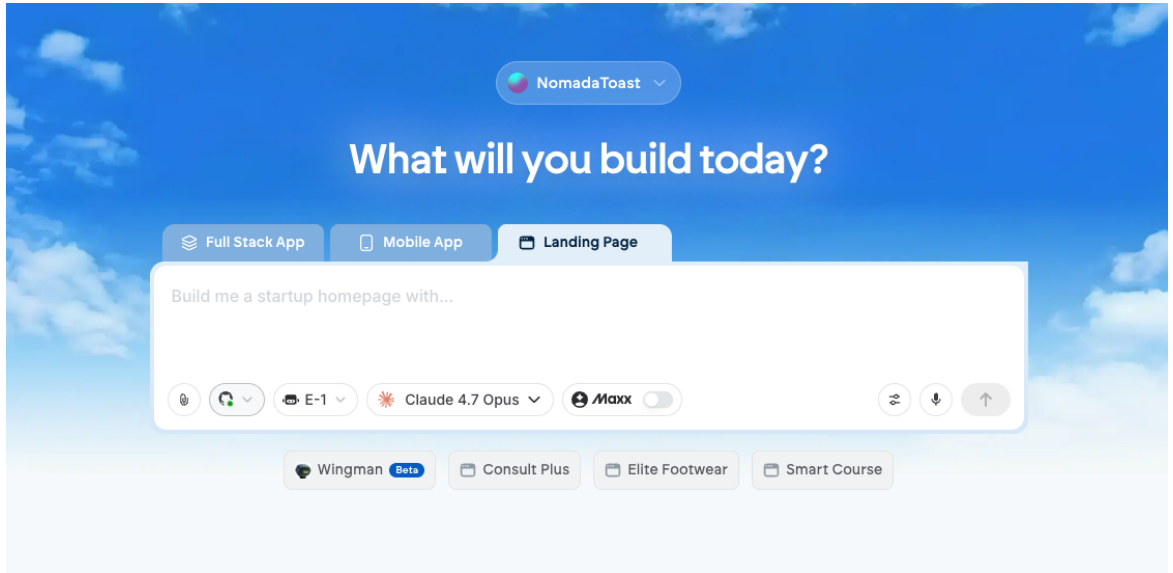
- The video is required because the prompt is written around a video-led hero.

Before moving on

The attach tooltip or file picker should appear from the paperclip button.

Back to index

Step 3: Paste the website reference



Goal

Give Emergent the site style it should preserve.

What to do

- Paste the website URL, copied website text, or reference material into the prompt box.

- The included TXT prompt tells Emergent to match the reference site style closely.

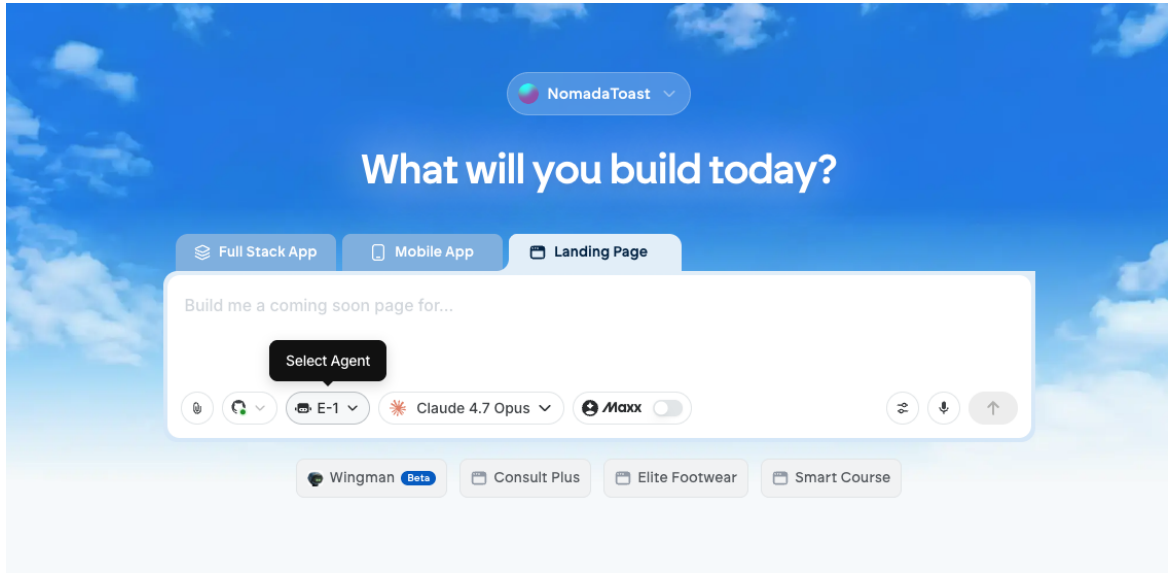
- The only major change should be rebuilding the hero around the attached video.

Before moving on

The prompt box should contain the website reference and the attached instruction file.

Back to index

Step 4: Choose the agent



Goal

Use an agent mode that fits a stable landing page build.

What to do

- Open the agent dropdown if you want to change the build behavior.

- For most users, the default stable agent is enough.

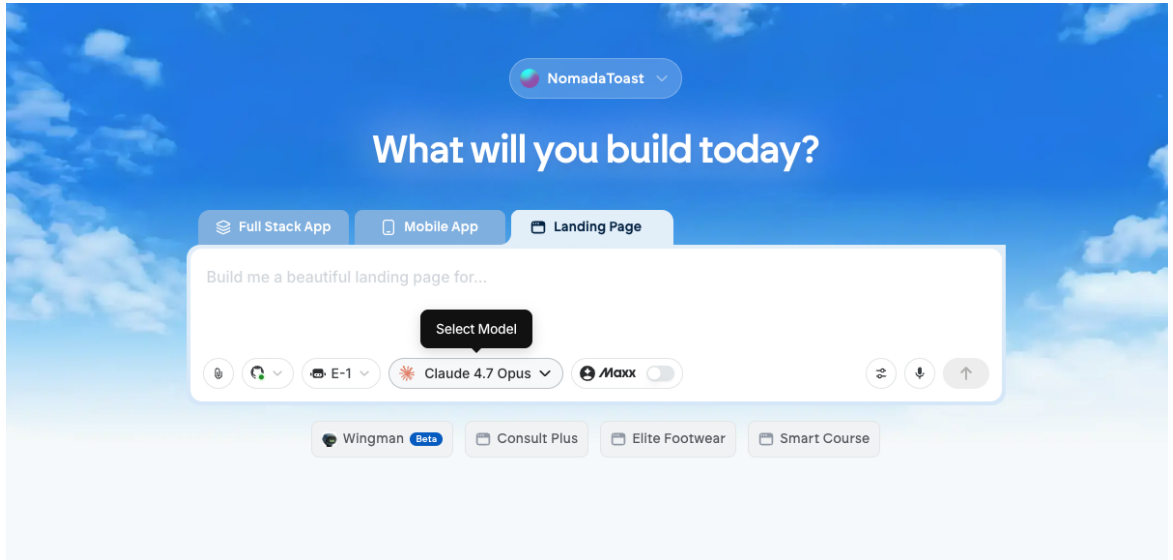
- Only change this if you know you want a more aggressive or specialized workflow.

Before moving on

An agent selector is visible near the bottom controls.

Back to index

Step 5: Choose the model



Goal

Pick the model that should interpret the prompt and build the site.

What to do

- Open the model dropdown to choose the model you want.

- Use a stronger model when style matching matters more than speed.

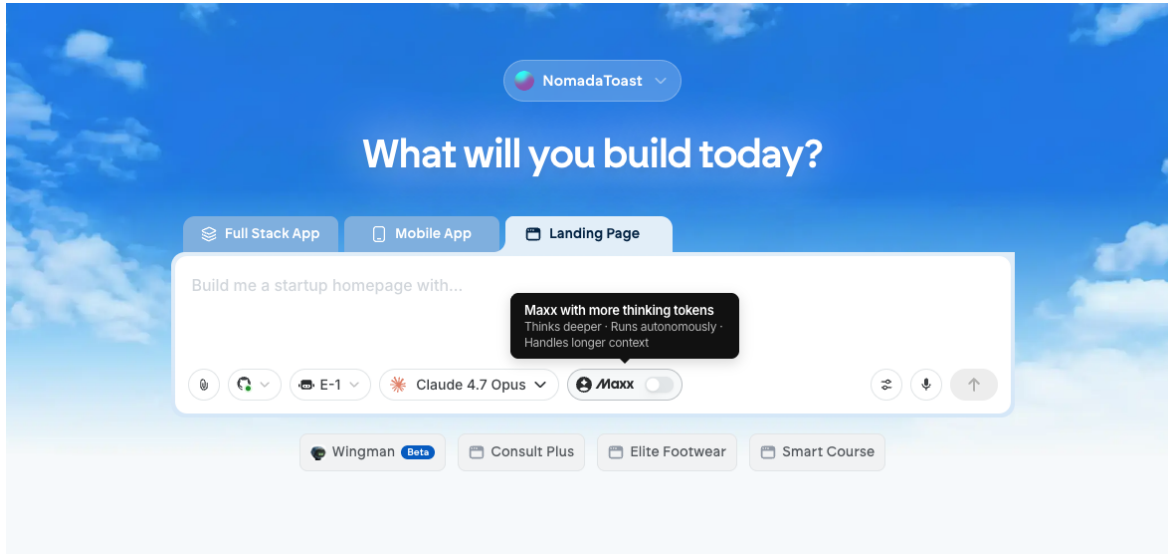
- The prompt is strict about preserving colors, UI style, UX rhythm, and hero behavior.

Before moving on

The selected model name should appear in the model pill.

Back to index

Step 6: Use Maxx for stronger reasoning



Goal

Give Emergent more reasoning budget when the reference site is visually detailed.

What to do

- Turn on Maxx when you want stronger interpretation of the reference site.

- This is useful for matching visual style, layout rhythm, UI details, and scroll behavior.

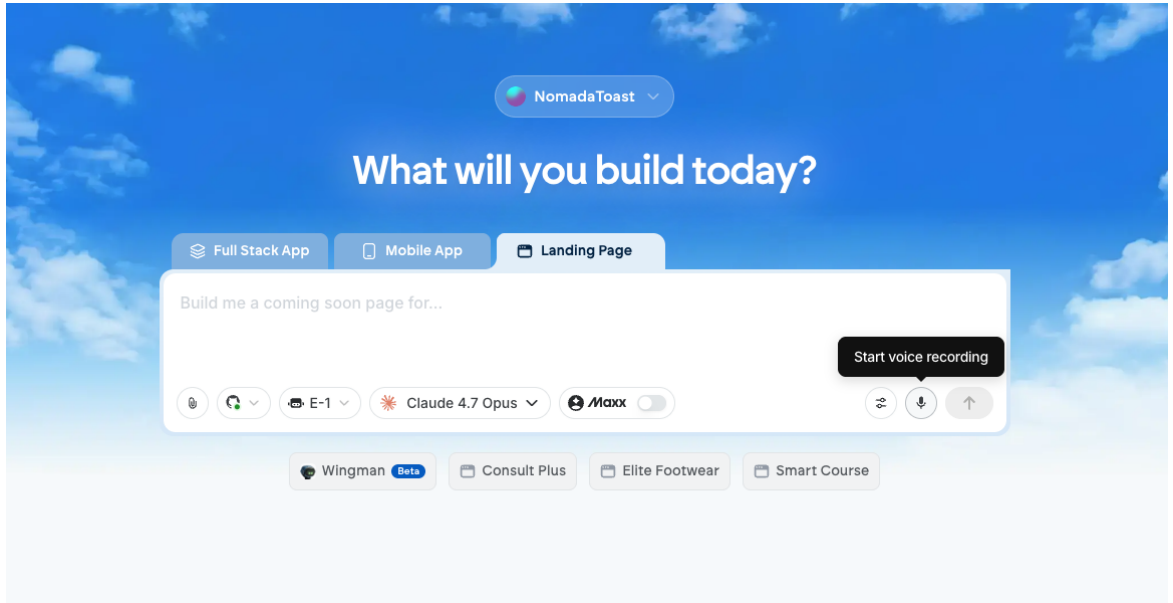
- For quick experiments, you can leave it off.

Before moving on

The Maxx toggle should show the setting you want before submitting.

Back to index

Step 7: Start voice recording only if needed



Goal

Use voice only when you want to add spoken detail.

What to do

- The microphone can add extra spoken instructions, but it is optional.

- For the cleanest workflow, the MP4, TXT prompt, and website reference are enough.

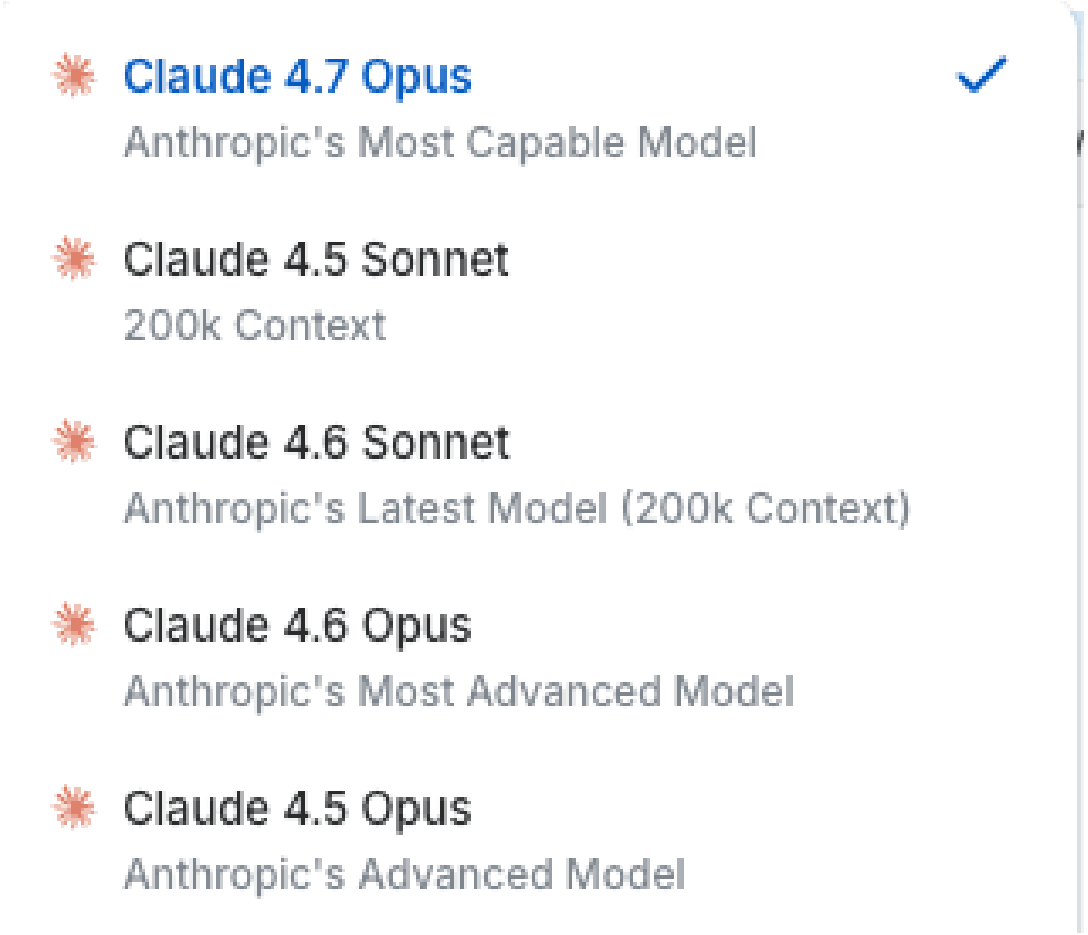
- Use voice only for extra context that is not already in the written prompt.

Before moving on

If you do not need voice input, leave the microphone alone and submit normally.

Back to index

Step 8: Claude model options



Goal

Understand when to use the Claude model choices.

What to do

- Claude 4.7 Opus is a strong choice for careful visual interpretation.

- Claude Sonnet options can be useful when you want a balance of speed and quality.

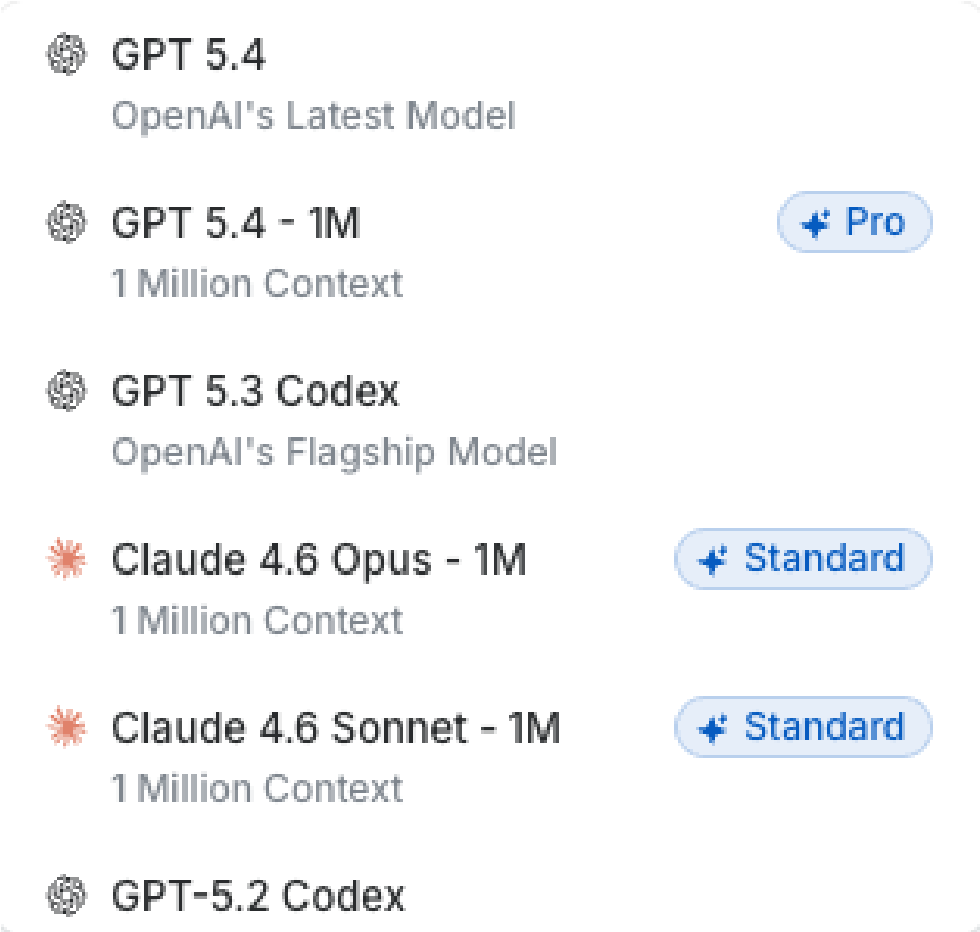
- Use stronger options when matching the reference site exactly is the priority.

Before moving on

Pick one model before submitting, then let Emergent build the page.

Back to index

Step 9: OpenAI and Codex model options



Goal

Understand the OpenAI model list when it appears.

What to do

- GPT models are useful for broad website generation and content interpretation.

- Codex models are useful when the implementation quality and code behavior matter.

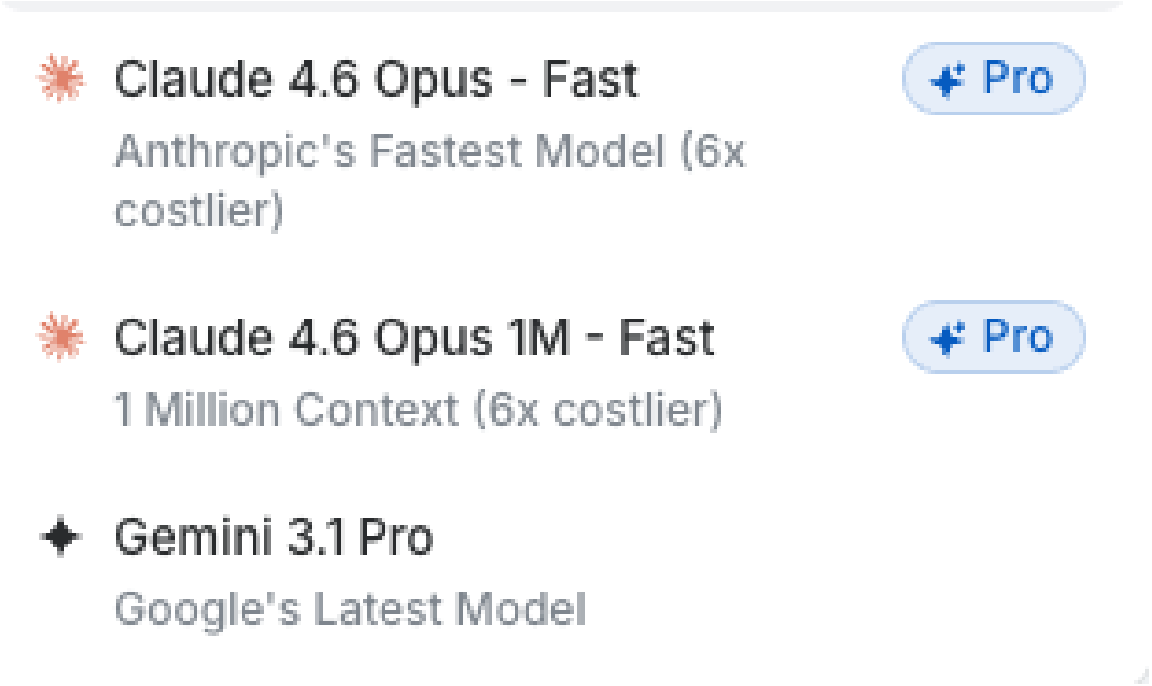
- Use a strong model when the site style is complex or the scroll video behavior needs precision.

Before moving on

Choose the model that best matches quality, speed, and cost preferences.

Back to index

Step 10: Pro model options



Goal

Know when Pro models are worth using.

What to do

- Pro options can be useful for difficult reference sites, polished results, or more demanding builds.

- Use them when visual fidelity, smooth interaction, and fewer retries are worth the extra cost.

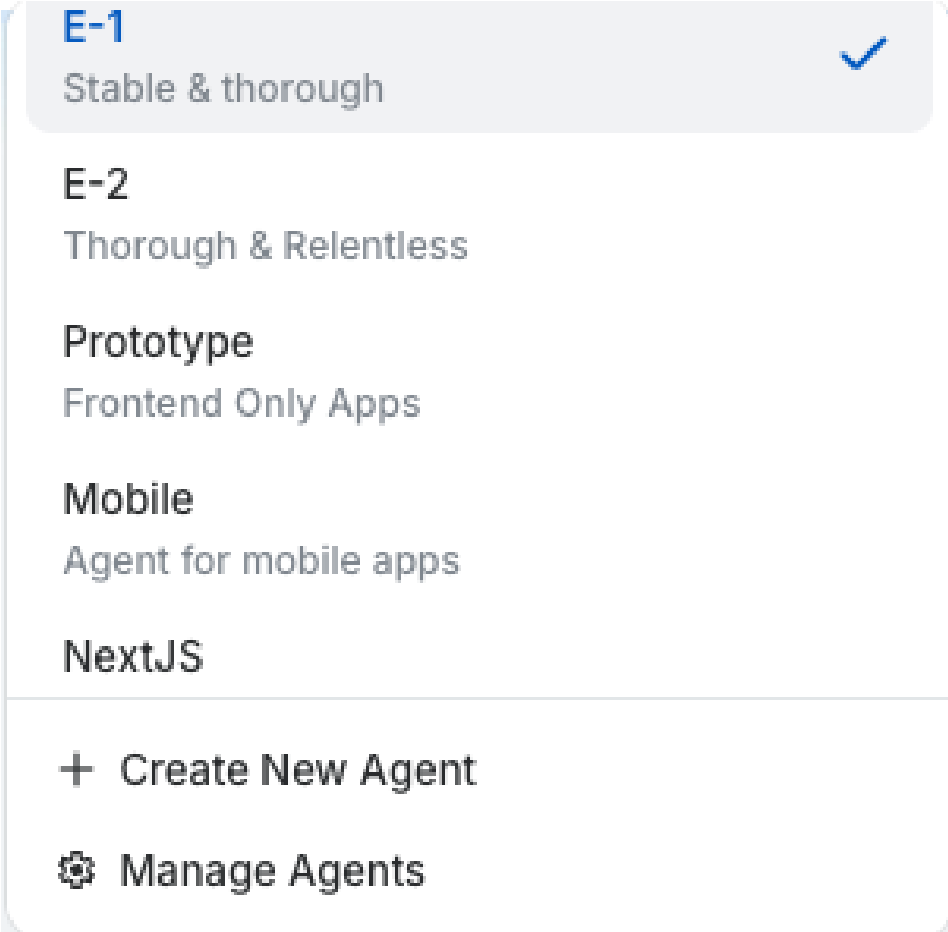
- For a quick test, a standard strong model is usually enough.

Before moving on

If a model is marked Pro, confirm you want to use that setting before submitting.

Back to index

Step 11: Agent mode options



Goal

Choose the agent behavior that fits the project.

What to do

- E-1 is stable and thorough, which is a good default for this workflow.

- E-2 is more relentless and may be useful for tougher builds.

- Prototype, Mobile, and NextJS are more specific modes. Use them only when they match the intended output.

Before moving on

For most landing pages, keep a stable general agent selected.

Website Inspiration Links

Use these sites to find the visual language you want Emergent to copy. Paste the chosen website or reference into Emergent with the prompt and MP4.

Awwwards nominees

https://www.awwwards.com/websites/nominees/

Best for premium interaction design, experimental layouts, motion, typography, video-led heroes, and award-level visual direction.

Behance

https://www.behance.net/

Best for brand systems, campaign visuals, landing page concepts, app UI, moodboards, and polished creative direction.

Webflow

https://webflow.com/

Best for practical website structure, responsive layouts, SaaS pages, and modern buildable web patterns.

Quality checklist before accepting the result

- The MP4 is the main hero visual, not a small side card or preview tile.
- The video progression is scroll-controlled, or the fallback still feels intentionally tied to scrolling.
- The generated site still matches the reference colors, UI style, UX behavior, and layout rhythm.
- The copied site name and product names were replaced with placeholders.
- The first viewport feels like the original site style rebuilt around the video.
